Intent

Adds an SELinux policy module in order to allow Workbench to run on SELinux-enabled systems without disabling enforcement.

Addresses [#4937](#)

Approach

The SELinux userspace includes tools for tracking what actions were denied to running applications and translating them into policy configuration. This output was used to indicate which rules would be necessary, and I wrote a specific policy based on those.

Automated Tests

It's not possible to build unit tests for this functionality, as it is external to the application itself. (It might be possible to create an end-to-end test in a VM, but that depends on a lot of infrastructure.)

QA Notes

This potentially touches every part of the system. We need to validate the entire workflow:

- Verify that installing the .rpm and .deb packages on both non-SELinux and SELinux systems works without errors
- Verify that all services start up successfully with SELinux in enforcing mode
- Verify that all workspace types function as expected, paying special attention to any functionality that might require access to system resources

- Verify that uninstalling the .rpm/.deb packages cleans up the SELinux policy

Documentation

TODO: This is scheduled to be released after 2024.12.0, so adding a news entry will need to wait.

Checklist

- ☐ If this PR adds a new feature, or fixes a bug in a previously released version, it includes an entry in NEWS.md
- ☒ If this PR adds or changes UI, the updated UI meets [accessibility standards](#)
- ☒ A reviewer is assigned to this PR (if unsure who to assign, check Area Owners list)
- ☐ This PR passes all local unit tests
